1. Campus Lost & Found

Problem Statement

> Students lose items and have no central place to report or find them. Build a tool where students post lost or found items with photos, and AI matches them by description and location.

Explanation

Students lose items such as ID cards, earphones, bottles and calculators, and there is no central place to report or find them. Notices end up scattered across WhatsApp groups, notice boards and security desks, so most items are never returned.

A fast, trustworthy lost-and-found system saves students money and stress, and shows how AI can turn messy, free-text reports into useful matches.

Who will use it: Students (who lose or find items), security/admin staff (who hold found items).

2. Smart Timetable Planner

Problem Statement

> Students struggle to balance classes, exams, and deadlines. Build a tool that takes courses and deadlines and auto-generates a clash-free study schedule.

Explanation

Students juggle lectures, labs, assignments, quizzes and exams. They often discover clashes or deadlines too late and fall into last-minute cramming.

A planner that automatically converts courses and deadlines into a realistic study plan reduces stress and improves grades.

Who will use it: Students of all years; optionally class representatives sharing a common schedule.

6. Canteen Queue & Pre-Order

Problem Statement

> Long queues make students miss classes. Build a pre-order system with plain-language ordering, load-balanced pickup slots, and a live kitchen view.

Explanation

Long canteen queues make students late or force them to skip meals. Staff are overwhelmed at peak times and orders are confused.

Pre-ordering with smart pickup slots saves student time and helps the canteen run smoothly and plan its stock.

Who will use it: Students (customers), canteen staff (kitchen), and canteen manager.
